Relevance of myosin light chain kinase in regulating contraction and relaxation. The ubiquitous importance of the myosin light chain (MLC) in regulating contraction in response to external signals suggests that there should be an equally ubiquitous signal transduction pathway operating on the MLC. An initial functional analysis of MLC kinase (MLCK) expression in a variety of tissues by Northern blotting suggests that the MLCK may be the most widespread signaling protein in the body. Analysis of the MLCK cDNA has identified multiple alternatively spliced transcripts, leading to the expectation of greater complexity in MLCK function. Initial functional analyses of MLCK isoforms and mutants have revealed this to be the case. The MLCK can be separated into an MLCK catalytic domain and a MLCK kinase domain, whose interaction is required for autoactivation of the catalytic domain. The catalytic domain has been found to be widely and selectively expressed. The MLCK catalytic domain has been fused with and can bind to a variety of ligands. A variety of ligands and a variety of functional domains have been
